Targeted Data Control

Summary condition NarrativeSlashTabularComponent

Ms. Debra24 Hernandez98Aj is a 51-year-old menopausal non hispanic or latino woman with invasive ductal carcinoma of the breast, diagnosed on 13 January 2012. Her most recent status, recorded on 15 May 2017, is of worsening, disease progression based on pathology, imaging, and symptoms.

She underwent a lumpectomy on missing date. She underwent a sentinel lymph node biopsy on 20 September 2012 which revealed infiltrating poorly differentiated ductal carcinoma, missing grade, estrogen receptor 0, etc. A diagnostic mammogram on 4 October 2013 revealed a 2 cm mass in the right breast at 7 o'clock and an indeterminate lymph node in the right axilla,

Summary all

Ms. Debra24 Hernandez98Aj is a 51-year-old menopausal non hispanic or latino woman with invasive ductal carcinoma of the breast, diagnosed on 13 January 2012. Her most recent status, recorded on 15 May 2017, is of worsening, disease progression based on pathology, imaging, and symptoms.

She underwent a lumpectomy on missing date. She underwent a sentinel lymph node biopsy on 20 September 2012 which revealed infiltrating poorly differentiated ductal carcinoma, stage IV, estrogen receptor 0, etc. A diagnostic mammogram on 4 October 2013 revealed a 2 cm mass in the right breast at 7 o'clock and an indeterminate lymph node in the right axilla, 13 mm.

She underwent right breast mass core biopsy and right axillary lymph node core biopsy on August 29, 2014 which revealed infiltrating poorly differentiated ductal carcinoma, stage 3, estrogen receptor 0, progesterone receptor weakly positive 1% to 4%, HER2 was negative 0%, and Ki-67 ranged 85% to 95%. Right axillary lymph node was negative for

History of present illness

Ms. Debra24 Hernandez98Aj is a 51-year-old premenopausal Hispanic woman who recalls an unremarkable mammogram December 3, 2013. She recalls feeling a sharp pain in her right breast about 8 months later, and feeling a palpable lump two months after that. A diagnostic mammogram on August 13, 2015, revealed a 2 cm mass in the right breast at 7 o'clock and an indeterminate lymph node in the right axilla, 13 mm. A right breast ultrasound on August 29, 2015 revealed mass measuring 1.6 cm, indeterminate right axillary lymph nodes, measuring 1.4 cm with the cortex of 3 mm - indeterminate, and another measuring 12 mm with cortex of 4 mm - indeterminate.

She underwent right breast mass core biopsy and right axillary lymph node core biopsy on August 29, 2014 which revealed infiltrating poorly differentiated ductal carcinoma, grade 3, estrogen receptor 0, progesterone receptor weakly positive 1% to 4%, HER2 was negative 0%, and Ki-67 ranged 85% to 95%. Right axillary lymph node was negative for malignancy. Stage IA T1c N0 M0 disease. BRCA1/2 testing was negative.

In preparation for treatment, a Port-A-Cath was placed on October 13, 2015. TTE done on October 15, 2015 showed normal systolic function, with ejection fraction 60-65% and trace mitral regurgitation.
